

Manual: 2.3. Network Setup

The software is now installed locally. If you are going to test the software, then you do not need to continue with a network setup. If you plan to look at the user interface from other computers, then a network setup is necessary.

The user interface broadcasts its webpage on port 3000. In order for you to be able to look at the interface from a different computer, the other computer must be able to have access to the IP-address of the application computer and the application computer must be able to send its content back. This may require firewall settings to be changed. As this depends on the setup of your particular network, please check with your IT department. On the application computer, port 3000 must be opened to the HTML protocol for it to be able to send its content out.
